This report (including any enclosures and attachments) has been prepared for the exclusive use and benefit of the commissioning party and solely for the purpose for which it is provided. Unless we provide express prior written consent, no part of this report should be reproduced, distributed or communicated to any third party. We do not accept any liability if this report is used for an alternative purpose from which it is intended, nor to any third party in respect of this report. Any data and information provided by third parties and referred to herein has not been checked or verified by us unless otherwise expressly stated within this report. This report was checked and approved on the date it was issued and is therefore valid on this date. Understanding, circumstances, regulations and professional standards do change, which could subsequently affect the validity of this report. This report is not to be used for detailed design of drainage systems. It is recommended that every drainage scheme uses hydraulic modelling software to finalise volume requirements and design details before drawings are produced.

Commercial in Confidence

1. Introduction

- 1.1. This Technical Note has been prepared by Unda Consulting Limited on behalf of Aitco Ltd, to address the concerns of Matthew Taylor of Wealden District Council.
- 1.2. The associated planning application relates to *Demolition of existing buildings in B1/B8 usage and café, followed by erection of 24 no. family houses.* These works are proposed to be undertaken at Old Loom Mill, Earsham Road, Halisham BN27 2RH.
- 1.3. Post development the total roof area of the twenty four new residential dwellings and two car ports will amount to approximately 2240m².

2. Existing Site:

2.1. The site is occupied by a former mill and is approximately 14631m² in size.

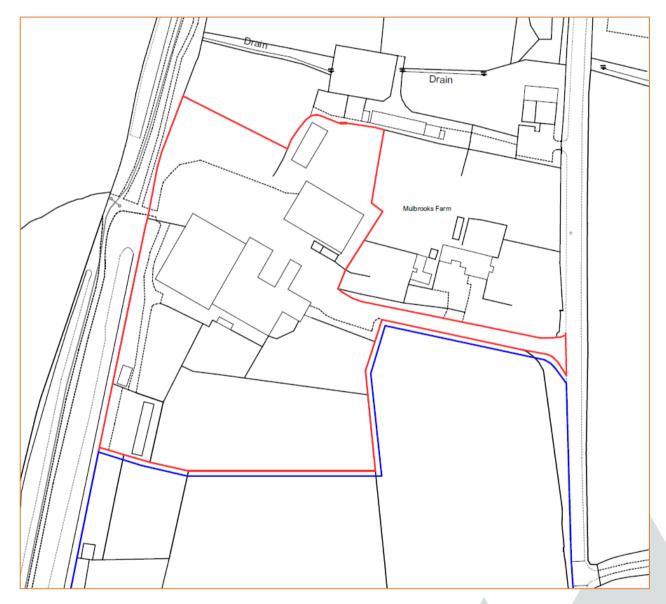

Figure 1: Site Location (Source: Ecotecture)

Commercial in Confidence

UND/

Figure 2: Aerial Imagery (Source: Google)

Site Topography:

- 2.2. A measured topographical survey has been undertaken at the site and provided by the client for inclusion within the report. This indicates that levels on site range between 4.71mAOD in the north and 10.79mAOD in the south west.
- 2.3. According to spot height levels, the site appears to generally slope from land in the south towards the northern periphery.
- 2.4. Based on the plans provided, the twenty four residential dwellings are proposed to be development upon land with an approximate elevation of between 4.82mAOD and 8.54mAOD.

Commercial in Confidence

Existing Ground Conditions:

2.5. Test results provided by Southern Testing Ltd indicate that all four Trial Pits failed to drain thus failed to complete the necessary drop in level (25% full) to calculate a compliant value for infiltration.

3. Development Proposals:

Proposed Development:

- 3.1. The proposed planning application is for redevelopment of the site with construction of twenty four new residential dwellings, with associated access road and parking.
- 3.2. Attenuation sizing within the strategy has been based on all newly introduced impermeable surfacing (6441m²), comprising both post development roof area and hardstanding. Thus significant betterment will be provided post development.

Figure 3: Proposed Site Layout Plan (Source: Ecotecture)

Commercial in Confidence

4. Surface Water Drainage Calculations and Maintenance:

Discharge Location:

4.1. Utilising the northern connection for post development runoff also corresponds with East Sussex County Council's consultation comments, dated 13th October 2017, which state:

Our preference is for the northern outfall to be used as this involves a short section of sewer and then discharges directly to the watercourse, unless the eastern outfall is proven to have significant benefits. We would request that each of the outfalls is investigated and the most appropriate outfall selected prior to the layout being fixed through any Reserved Matters application. This will also depend on the topography of the site.

Proposed Discharge Rate:

- 4.2. Existing greenfield runoff rates for the site have been calculated as 6.4 l/s for the 1:1 annual runoff event, 17.0 l/s for the 1:30 year event and 24.0 l/s for the 1:100 year event. Refer to calculations in appendix.
- 4.3. East Sussex County Council consultation response WD/2017/0839/MAO, dated 13th October 2017 states *surface water runoff from the proposed development should be limited to the 3.2 l/s, for all rainfall events, including those with a 1 in 100 (plus climate change) annual probability of occurrence.*
- 4.4. In light of this, it is proposed to discharge post development runoff to watercourse at a maximum rate of 3.2l/s using a Hydro-Brake.

Proposed SuDS:

- 4.5. The client has confirmed that they would like to incorporate rain gardens and a pond within the proposed scheme. In order to provide sufficient storage to accommodate all post development runoff during the 1 in 100 year plus climate change event a number of separate SuDS features are proposed within the project.
- 4.6. Below is a summary of the proposed mechanisms of surface water drainage at the site for each element of the scheme.

Element	Raingarden	Pond	Tanked Permeable Paving	Attenuation Storage Tank
Road, Paving and Parking				
Roof Area: Plots 1 – 4				
Roof Area: Plots 5 - 6				
Roof Area: Plots 7 – 8				
Roof Area: Plot 9				
Roof Area: Plots 10 – 24				
Car Ports				

Tanked Permeable Paving :

- 4.7. Part of the proposed access road will be surfaced in tanked permeable paving amounting to 2342m². Runoff from this area will percolate through the paving and be stored within a gravel sub-base. Check dams will be utilised within the sub-base where the topography is on a gradient, so as to maximise storage potential.
- 4.8. All water within the tanked permeable paving sub-base will be gradually discharged to the watercourse some 35m north of the site via outflow device.
- 4.9. Surface water runoff from the remaining impermeable element of the access road (479m²), proposed paving (1380m²) and the roof areas of plots 7 and 8 (241m²), will also be directed to the area of tanked permeable paving.
- 4.10. In order to comply with CIRIA C753 The SuDS Manual, a 10% allowance needs to be added to the roof area of plots 7 and 8 to take into account future urban creep. Applying a 10% allowance to the roof areas of plots 7 and 8 (241m²) gives a value of 265.1m².
- 4.11. In light of this all drainage calculations for sizing the tanked permeable paving have been made on the basis of a total impermeable area of 4466.1m² (2821m² of access road, 1380m² of paving and 265.1m² of roof area).

Commercial in Confidence

Technical Note - 89594-Ecotecture-OldLoomMill-180121-v1.0

- 4.12. Outflow from the proposed drainage system (tanked permeable paving) to the drainage ditch will be limited to 2.1 l/s for all storms up to, and including, the 1:100 year + 40% climate change event via a hydrobrake. The hydrobrake will be installed in an inspection chamber within the site.
- 4.13. Preliminary calculations indicate that tanked permeable pavement with dimensions of 2342m² x 0.5m deep x 0.3 (voids) will be sufficient to accommodate all runoff from 4201m² of impermeable surfacing and 265.1m² of roof area arising from the critical 1:100 year + 40% Climate Change event.
- 4.14. Preliminary calculations indicate that some 342.0m³ of storage is required to attenuate the runoff for all storms up to and including the 1:100 year + 40% Climate Change event.
- 4.15. Refer to enclosed MicroDrainage calculations.
- 4.16. The highest pollution hazard level for the proposed land use is Low (residential car parks and low trafficked roads). The pollution hazard indices for this land use are shown in Table 1 below.

Total suspended solids (TSS)	Metals	Hydrocarbons	
0.5	0.4	0.4	

Table 1: Pollution Hazard Indices for the proposed site (from Table 26.2 of CIRIA C753 The SuDS Manual)

4.17. All SuDS components are assessed for their effectiveness in pollutant removal prior to discharge to sewer in Table 26.3 in CIRIA C753 The SuDS Manual. The pollution mitigation indices for permeable paving are show in Table 2 below.

Total suspended solids (TSS)	Metals	Hydrocarbons	
0.7	0.6	0.7	

Table 2: Pollution Mitigation Indices for permeable pavements (from Table 26.3 of CIRIA C753 The SuDS Manual)

4.18. The Pollution Mitigation Indices for permeable pavement are greater than the Pollution Hazard Indices for car parks and low trafficked roads. Therefore, permeable pavements will provide sufficient water quality treatment prior to discharge.

Raingardens (Bioretention):

- 4.19. According to landscape plans, several areas have been made available for the incorporation of above ground SuDS.
- 4.20. It is proposed to utilise two of these designated areas to install raingardens. Raingardens offer a form of attenuation storage whilst providing biodiversity and amenity benefits. According to CIRIA SuDS Manual raingardens also provide a very effective treatment functionality through the removal of sediments and pollutants by filtration through the vegetation and underlying filter mediums.
- 4.21. Two rain gardens will be constructed, one in the south western corner of the site and one in the west, to accept roof runoff from plots 1 to 4 and plot 9, respectively.
- 4.22. Given that both raingardens are to be designed to accept roof runoff a 10% allowance needs to be added to comply with CIRIA C753: future urban creep. Applying a 10% allowance to the roof areas of plots 1 to 4 and plot 9 (341m² and 148m²) gives values of 375.1m² and 162.8m², respectively.
- 4.23. Based upon plans provided, the rain garden in the south western corner will have a surface area of 129m² and will be of sufficient size to accommodate surface water runoff from the roof areas (including urban creep allowance) of plots 1 to 4 during the 1 in 100 year plus (40%) climate change event.
- 4.24. The second rain garden, in the west, will reportedly cover an area of 38m². Whilst this rain garden is proposed to have a shallower sub-base and freeboard, it has also been designed to be of sufficient size to accommodate all runoff from roof areas associated with plot 9 for the 1 in 100 year plus (40%) climate change event.

Commercial in Confidence

- 4.25. Stones and gravel will be laid at the inlet of both rain gardens to dissipate the energy of entering water and prevent heavy flows from washing soils away.
- 4.26. In accordance to best practise guidance rain gardens should be located:
 - In full sun or partial shade;
 - Within a natural topographic low point in relation to the surrounding area;
 - At least 3m (10ft) away from the house, to avoid any damage to foundations by infiltrating water;
 - In a well-drained area, on a very gentle incline (10% or less);
 - Where it is practical to install a pipe leading to the main drainage system below the rain garden in case of excessively heavy storms.
- 4.27. In order to provide the maximum amount of storage possible, whilst achieving gravity connection to the proposed pond, the rain gardens will be constructed as flows:

Raingarden 1 (129m²): Serving plots 1 to 4

- Freeboard of 300mm,
- Topsoil (ratio 50% sand, 30% topsoil and 20% compost) of 300mm
- Sub-base of 500mm.

Raingarden 2 (38m²): Serving plot 9

- Freeboard of 200mm,
- Topsoil (ratio 50% sand, 30% topsoil and 20% compost) of 300mm
- Sub-base of 300mm.
- 4.28. An under-drain will be installed within the sub-base of the rain gardens to ensure both drain effectively and prevent waterlogging.
- 4.29. An 18mm diameter orifice will be installed to control discharge from rain garden 1, serving plots 1 to 4, and reduce flows to less 0.5 litres/second.
- 4.30. A 21mm diameter orifice will be installed to control discharge from rain garden 2, serving plot 9, and reduce flows to less 0.5 litres/second.
- 4.31. From both rain gardens, water will be discharged at a controlled rate into the pond (refer to the following section).
- 4.32. Refer to report appendix for suggested planting and raingarden schematics.
- 4.33. The highest pollution hazard level for the proposed land use is Very Low (residential roofs). The pollution hazard indices for this land use are shown in Table 1 below.

Total suspended solids (TSS)	Metals	Hydrocarbons	
0.2	0.2	0.05	

Table 3: Pollution Hazard Indices for the proposed site (from Table 26.2 of CIRIA C753 The SuDS Manual)

4.34. All SuDS components are assessed for their effectiveness in pollutant removal prior to discharge to sewer in Table 26.3 in CIRIA C753 The SuDS Manual. The pollution mitigation indices for raingardens (Bioretention)are show in Table 2 below.

Total suspended solids (TSS)	Metals	Hydrocarbons
0.8	0.8	0.8

Table 4: Pollution Mitigation Indices for raingardens (Bioretention) (from Table 26.3 of CIRIA C753 The SuDS Manual)

4.35. The Pollution Mitigation Indices for the raingardens (Bioretention) are greater than the Pollution Hazard Indices for car parks and low trafficked roads. Therefore, raingardens (Bioretention) will provide sufficient water quality treatment prior to discharge.

Commercial in Confidence

Pond (Attenuation Basin):

- 4.36. Runoff from the proposed roof areas associated with plots 1 to 6, plot 9 and the two car ports will be directed into an attenuation basin Sustainable Urban Drainage System (SUDS) situated in the centre south of the site. The main purpose of the pond will be to attenuate surface water runoff from the southerly most roof areas; however it will also provide ecological and aesthetic benefits.
- 4.37. Roof runoff from plots 5 and 6 (241m²) and the two car ports (202m²) will be connected directly to an attenuation basin located to in the centre south of the development.
- 4.38. Given that plots 5 and 6 are residential, an urban creep allowance needs to be applied. Plots 5 and 6 comprise some 241m² of potentially impermeable surfacing. In order to comply with CIRIA C753 The SuDS Manual, a 10% allowance will be added to take into account future urban creep. Therefore, drainage calculations have been made on the basis of a total contributing impermeable area for plots 5 and 6 of 265.1m².
- 4.39. Runoff from plots 1 to 4 and 9 will be directed towards respective rain gardens prior to discharge to the attenuation basin. Discharge from each of the rain gardens into the pond will be limited to a maximum of 0.5 l/s. Refer to preceding section for information on the proposed raingardens.
- 4.40. Outflow from the attenuation basin to the drainage ditch will be limited to 0.5 l/s for all storms up to, and including, the 1:100 year + 40% climate change event via a hydrobrake. The hydrobrake will be installed in an inspection chamber within the site.
- 4.41. Preliminary calculations indicate that an attenuation basin with dimensions of $264.2m^2 \times 1.5m$ deep will be sufficient to accommodate all runoff from $1005m^2$ of impermeable surfacing arising from the critical 1:100 year + 40% Climate Change event.
- 4.42. The pond will provide an attenuation volume of 51.7m³ for surface water runoff from the development. The maximum attenuated water depth within the pond will be 0.403m.
- 4.43. The basin will retain a permanent water level at a depth of 0.5m; this can be utilised to provide biodiversity enhancement as part of the development and contribute towards the general amenity value of the scheme. All attenuation required for management of runoff from the catchment draining to the pond will be located above the permanent water volume but below the required 0.5m freeboard.
- 4.44. The basin design includes 0.597m of freeboard, above the maximum water level. This will mitigate residual flood risk from blockage or exceedance storm events.
- 4.45. Refer to enclosed MicroDrainage calculations.
- 4.46. The highest pollution hazard level for the proposed land use is Low (residential car parks and low trafficked roads). The pollution hazard indices for this land use are shown in Table 1 below.

Total suspended solids (TSS)	Metals	Hydrocarbons	
0.5	0.4	0.4	

Table 5: Pollution Hazard Indices for the proposed site (from Table 26.2 of CIRIA C753 The SuDS Manual)

4.47. All SuDS components are assessed for their effectiveness in pollutant removal prior to discharge to sewer in Table 26.3 in CIRIA C753 The SuDS Manual. The pollution mitigation indices for pond (attenuation basin) are show in Table 2 below.

Total suspended solids (TSS)	Metals	Hydrocarbons
0.7	0.7	0.5

Table 6: Pollution Mitigation Indices for pond (attenuation basin) (from Table 26.3 of CIRIA C753 The SuDS Manual)

4.48. The Pollution Mitigation Indices for pond (attenuation basin) are greater than the Pollution Hazard Indices for car parks and low trafficked roads. Therefore, pond (attenuation basin) will provide sufficient water quality treatment prior to discharge.

Commercial in Confidence

Attenuation Storage:

- 4.49. Surface water runoff from roof areas associated with plots 10 to 24 will be directed to and stored within an attenuation storage tank.
- 4.50. According to plans made available by the client the total roof area associated with plots 10 to 24 amounts to some 1066m² of potentially impermeable surfacing.
- 4.51. In order to comply with CIRIA C753 The SuDS Manual, a 10% allowance will need to be added to the roof areas to account future urban creep in this area. Applying a 10% allowance to the roof areas (1066m²) gives a value of 1172.6m². In light of this, all drainage calculations for the attenuation storage tank have been made on the basis of an impermeable coverage of 1172.6m².
- 4.52. From the attenuation storage tank, runoff will be gradually discharged to the drainage ditch some 35m north of the site, via the existing surface water infrastructure.
- 4.53. Outflow from the attenuation tank to the drainage ditch will be limited to a maximum of 0.6 l/s for all storms up to, and including, the 1:100 year + 40% climate change event via a hydrobrake. The hydrobrake will be installed in an inspection chamber within the site.
- 4.54. Preliminary calculations indicate that sufficient storage required to attenuate runoff from the proposed impermeable areas (1172.6m²) associated with plots 10 to 24, arising from the critical 1:100 year + 40% climate change event, can be provided within an attenuation storage tank of dimensions 120.0m² x 1.0m deep.
- 4.55. Preliminary calculations indicated that some 92.5m³ of storage is required to attenuate the runoff for all storms up to and including the 1:100 year + 40% climate change event.
- 4.56. Refer to enclosed MicroDrainage calculations.
- 4.57. Runoff from roof areas is considered to be uncontaminated and does not warrant any form of treatment process to improve water quality. Nevertheless, it is suggested to include debris / sediment traps on any new drainage.

Water Quality:

4.58. In addition to the water quality improvements stated in the previous sections, there will be an oil interceptor located upstream of the outfall to the watercourse. This will further reduce the pollution before the water leaves the site.

Commercial in Confidence

5. Discussion and Conclusions:

- 5.1. This Technical Note has been prepared by Unda Consulting Limited on behalf of Aitco Ltd, to address the concerns of Matthew Taylor of Wealden District Council.
- 5.2. The site is occupied by a former mill and is approximately 14631m2 in size.
- 5.3. A measured topographical survey has been undertaken at the site and provided by the client for inclusion within the report. This indicates that levels on site range between 4.71mAOD in the north and 10.79mAOD in the south west.
- 5.4. Based on the plans provided, the twenty four residential dwellings are proposed to be development upon land with an approximate elevation of between 4.82mAOD and 8.54mAOD.
- 5.5. The proposed planning application is for redevelopment of the site with construction of twenty four new residential dwellings, with associated access road and parking.
- 5.6. Attenuation sizing within the strategy has been based on all newly introduced impermeable surfacing (6441m²), comprising both post development roof area and hardstanding. Thus significant betterment will be provided post development.

Surface Water Drainage Strategy Discussion

- 5.7. Test results provided by Southern Testing Ltd indicate that all four Trial Pits failed to drain thus failed to complete the necessary drop in level (25% full) to calculate a compliant value for infiltration.
- 5.8. Utilising the northern connection for post development runoff also corresponds with East Sussex County Council's consultation comments, dated 13th October 2017, which state:

Our preference is for the northern outfall to be used as this involves a short section of sewer and then discharges directly to the watercourse, unless the eastern outfall is proven to have significant benefits. We would request that each of the outfalls is investigated and the most appropriate outfall selected prior to the layout being fixed through any Reserved Matters application. This will also depend on the topography of the site.

- 5.9. Existing greenfield runoff rates for the site have been calculated as 6.4 l/s for the 1:1 annual runoff event, 17.0 l/s for the 1:30 year event and 24.0 l/s for the 1:100 year event. Refer to calculations in appendix.
- 5.10. Outflow from the site will be limited by three hydro-brake flow control devices to a combined maximum rate of 3.2 l/s.
- 5.11. Below is a summary of the proposed mechanisms of surface water drainage at the site for each element of the scheme.

Element	Raingarden	Pond	Tanked Permeable Paving	Attenuation Storage Tank
Road, Paving and Parking				
Roof Area: Plots 1 – 4				
Roof Area: Plots 5 - 6				
Roof Area: Plots 7 – 8				
Roof Area: Plot 9				
Roof Area: Plots 10 – 24				
Car Ports				

- 5.12. Refer to pages 5-9 for further information regarding the individual SuDS sizing and how each feature will reduce contaminants.
- 5.13. In addition to the water quality improvements stated in the previous sections, there will be an oil interceptor located upstream of the outfall to the watercourse. This will further reduce the pollution before the water leaves the site to form a two-stage filtration system.
- 5.14. The roof runoff from plots 10 to 24 which is considered uncontaminated has a single stage filtration as there is not room within the scheme for a second stage.

Commercial in Confidence

Technical Note - 89594-Ecotecture-OldLoomMill-180121-v1.0

5.15. This drainage strategy has been undertaken in accordance with the principles set out in NPPF. We can conclude that providing the development adheres to the conditions advised above, the said development proposals can be accommodated without increasing flood risk within the locality in accordance with objectives set by Central Government and the EA.

INTRODUCTION Α

1 Authority

Our authority for carrying out this work is contained in a Southern Testing Project Order form (dated 18 June 2020) completed by Mr C Frost of Future Planning and Development Ltd. On behalf of Aitco Ltd.

2 Location

The site is located approximately 2km to the south of Hailsham town centre. The National Grid Reference of the site is TQ 58820 07250. The site location is indicated on Figure 1 within Appendix A.

3 **Background & Objectives**

It is proposed to redevelop the site with residential properties, which includes areas of proposed attenuation ponds/swales. The object of this investigation was to assess the soakage potential of soils on site.

4 Scope

This factual report presents our exploratory hole logs and test results only. Contamination and geotechnical issues are not considered in this report.

A UXO risk assessment was not requested within our brief for the investigation.

As with any site there may be differences in soil conditions between exploratory hole positions.

This report is not an engineering design and the figures and calculations contained in the report should be used by the Engineer, taking note that variations will apply, according to variations in design loading, in techniques used, and in site conditions. Our figures therefore should not supersede the Engineer's design.

The site investigation has been completed with reference to BS 5930[1] and BS 10175[2]

The findings and opinions conveyed via this investigation report are based on information obtained from a variety of sources as detailed within this report, and which Southern Testing Laboratories Ltd. believes are reliable. Nevertheless, Southern Testing Laboratories Ltd. cannot and does not guarantee the authenticity or reliability of the information it has obtained from others.

The investigation was conducted and this report has been prepared for the sole internal use and reliance of Aitco Ltd. and their appointed Engineers. This report shall not be relied upon or transferred to any other parties without the express written authorisation of Southern Testing Laboratories Ltd. If an unauthorised third party comes into possession of this report they rely on it at their peril and the authors owe them no duty of care and skill.

The recommendations contained in this report may not be appropriate to alternative development schemes.

B SITE SETTING

5 Geology

The British Geological Survey 1:50,000 map of the area (No. 319/334 - Lewes & Eastbourne) indicates that the site geology consists of the Weald Clay Formation.

5.1.1 Weald Clay Formation

The Weald Clay Formation comprises dark grey thinly-bedded shales and mudstones with subordinate siltstones, sandstones (including the Horsham Stone Member), shelly limestones and clay ironstones. The mudstones weather to yellow and brown clays. Conspicuous bands of red clay also occur, usually in close association with sandstone beds.

The clays have often been worked for various purposes, and the clay ironstone, a low-grade iron ore, was worked from sporadic beds across the Wealden area. The steep sides of the degraded remains of former workings are usually unstable. Other workings have been filled with a variety of materials.

This formation is known to contain pyrite.

6 Site Description

The subject site, which is approximately rectangular in shape and extends to around 145×95m, comprises a vacant mill, together with numerous outbuildings. The site is understood to have most recently been used for a number of commercial/retail purposes including a tearoom, fabric shop and craft units.

Approximately half of the site is covered by buildings, some of which were noted to have corrugated asbestos cement roofs, and hardstanding areas, which include concrete and compacted granular material. The remainder of the site comprises grassed areas, overgrown shrubs/bushes and numerous semi-mature to mature trees.

Access was not available within the buildings, however, some areas of rubbish/fly-tipped materials were observed within some external hardstanding areas, most notably in the centre/west of the site.

The site is set within a predominantly rural area, which comprises fields and scattered residential/commercial properties, together with the Cuckoo Trail (a former railway line) forming the western site boundary.

The site is largely flat and level, although ground levels were noted to fall gently by approximately 1-2m in the north of the site, towards to the northern boundary.

6.1 Site Photographs

A series of photographs showing the site at the time of our investigation is included in Appendix C.

С **GROUND INVESTIGATION**

7 **Strategy and Method**

The strategy adopted for the intrusive investigation comprised the following:

Activity / <i>Method</i>	Purpose	Max Depth (bgl)	Installations / Notes
TP1-TP4 8T Tracked Excavator	Trial pits to investigate the shallow ground conditions and allow for the preliminary assessment of soakage potential using the BRE365 method, at locations agreed with the client.	2.8-3.0m	One day of testing undertaken as requested by the client's engineer.

Access was slightly restricted due to the presence of buildings, underground/overhead services and rubbish/fly-tipped waste etc. The exploratory hole locations are shown on Figure 2 in Appendix A.

In-situ test and sampling method descriptions employed are given in Appendix B together with the test results.

Weather Conditions 8

The fieldwork was carried out on 26th June 2020, at which time the weather was dry and sunny. Whilst in general, the winter of 2019/20 had been wetter than average, based on rainfall records from the Southern Water region, the 3 month period prior to the soakage testing was drier than average (see table below).

Month	Long Term Average Rainfall	Actual Rainfall	Actual vs Average Percentage
April 2020	51.8mm	47.2mm	90%
May 2020	52.8mm	6.7mm	15%
June 2020	53.0mm	44.8mm	85%

* Data source: https://www.southernwater.co.uk/water-for-life/regional-rainfall

9 Soils as Found

The soils encountered are described in detail in the attached exploratory hole logs (Appendix A), but in general comprised a covering of Topsoil (0.3-0.4m) over stiff to very stiff, silty/plastic clay, with occasional ironstone gravel. Within trial pit TP3, carried out in an area of hardstanding composed of compacted granular, made ground was encountered to a depth of approximately 0.7m(bgl), which included frequent bricks and brick fragments, timber, plastic, plywood and rope etc.

Groundwater Observations 10

During the fieldwork, groundwater was not encountered in any of the trial pits prior to soakage testing.

TEST RESULTS D

11 Soakaways

Soakage Test Results 11.1

The BRE paper DG365 [3] describes a method for site testing to determine soil infiltration rates at the proposed site of a soakaway. The in-situ test method is described in Appendix B.

A total of four soakage tests were carried out across the site, at the locations shown on the attached site plan Figure 2, Appendix A. The full results of the soakage tests are presented within Appendix B.

For design purposes, the DG365, states that each pit should be allowed to drain three times to near empty, with filling on the same or consecutive days. However, as requested by the client's engineer, only a single day of testing was requested as a preliminary assessment of the soakage potential and given the very poor permeabilities anticipated due to the mapped presence of clay soils. The infiltration rate from each trial hole is summarised in the table below.

Test ID	Test Depth	Design Infiltration Rate		Notes
	(bgl)	ℓ/m²/minute	m/sec	
TP1	0.94-3.00m	n/a	n/a	Water level did not fall at all (ie. <1cm) within the test period of 286 mins
TP2	0.97-2.90m	n/a	n/a	Water level did not fall at all (ie. <1cm) within the test period of 310 mins
TP3	0.98-3.00m	n/a	n/a	Water level did not fall at all (ie. <1cm) within the test period of 248 mins
TP4	0.98-2.80m	n/a	n/a	Water level did not fall at all (ie. <1cm) within the test period of 219 mins

Negligible infiltration was measured during the 219-310 minutes of the testing undertaken in each trial pit.

11.2 General Guidance on Design of Soakaways

Any soakaway/drainage scheme may require the approval of the Environment Agency and Building Control.

Soakaways are used to store the immediate surface water run-off from hard surfaced areas, such as roof or carparks, and allow for efficient infiltration into the adjacent soil. They should be designed to discharge their stored water sufficiently quickly to provide the necessary capacity to receive run-off from a subsequent storm. The time taken for discharge depends upon the soakaway shape and size, and the surrounding soil's infiltration characteristics.

Groundwater levels can vary considerably from season to season and year to year, often rising in wet or winter weather, and falling in periods of drought. As such, a high groundwater table may affect the storage capacity of soakaways. In addition, it should be noted that an unsaturated zone may be required between the base of soakaways and the groundwater table, by the Environment Agency. Longer term monitoring may be required to establish actual groundwater levels as part of the planning approval process.

APPENDIX B

Field Sampling and In-Situ Test Methods and Results

Soil and Rock Descriptions

All soil and rock descriptions are in general accordance with BS5930 Ref [1].

Anthropogenic soils ('made ground' or 'fill') describe materials which have been placed by man and can be divided into those composed of reworked natural soils and those composed of or containing man-made materials. 'Fill' is used to describe material placed in a controlled manner and 'made ground' is used to describe materials placed without strict engineering control.

The classification of materials such as topsoil is based on visual description only and should not be interpreted to mean that the material complies with criteria used in BS 3882 Ref [4].

Chalk descriptions are based on CIRIA C574 Ref [5] and Mortimore Ref [6].

The geology code is only provided on logs where a positive identification of the sample strata has been made.

Trial Pits and Trenches

Trial pits and trenches are unsupported excavations, mechanically excavated by machine to the required depth to enable visual examination, in situ testing and sampling as required from outside the excavation.

Hand Penetrometer Test

The handheld soil penetrometer consists of a spring loaded and calibrated plunger which is forced into cohesive soil. A reading of unconfined compression strength (equal to twice cohesion) is given on a calibrated scale. The average of a set of three readings shall be recorded.

In common with other hand methods of strength assessment it does not give an accurate indication of bearing capacity in stiff or fissured soils, because of the small test area.

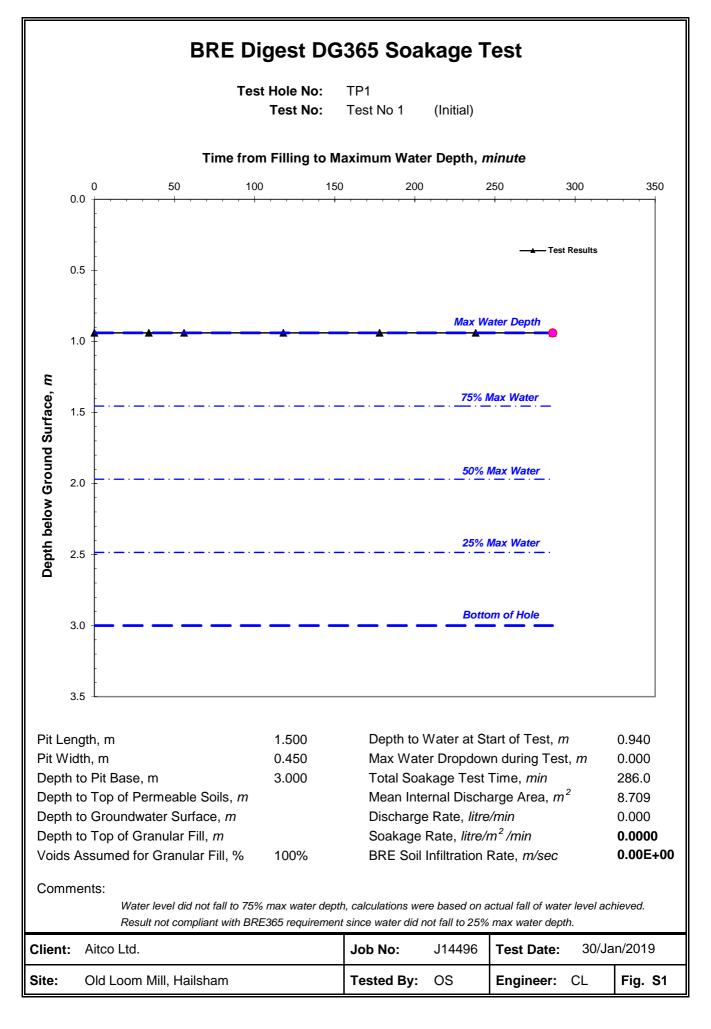

Soakage Tests (after BRE DG365 2016)

The BRE DG365 Ref [3] paper on soakaway design allows for the design of trench soakaways as well as traditional square and circular soakaways.

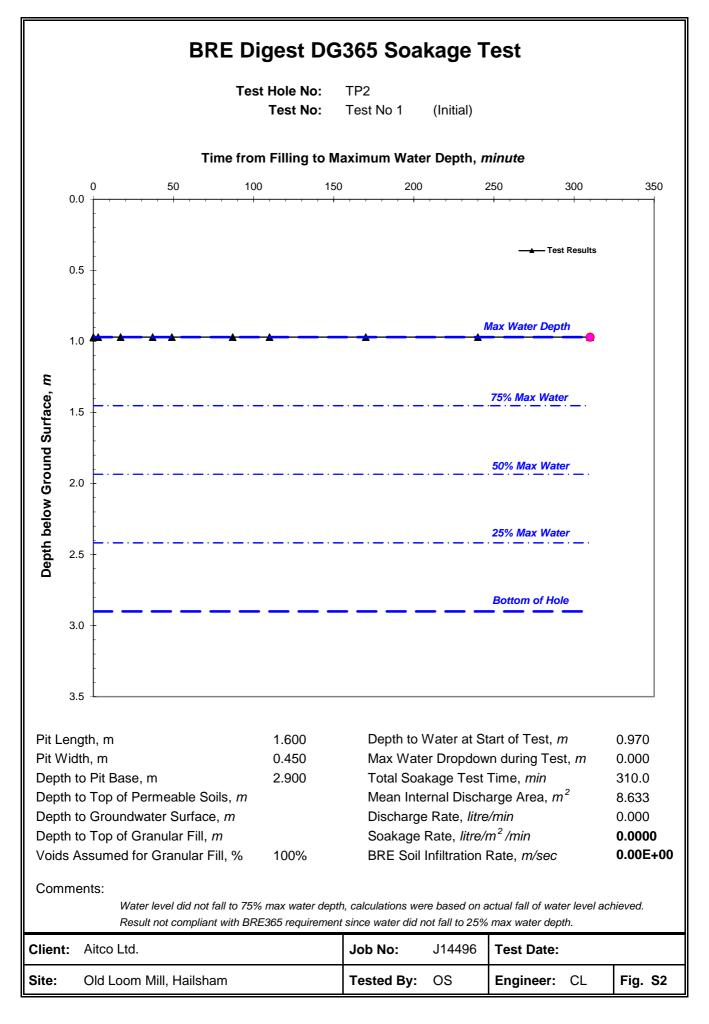

The test to measure the soil infiltration rate is carried out in pits which are excavated to the full depth of the proposed soakaway. The trial pits are filled and allowed to drain to empty or near empty, three times, on the same day or on consecutive days. Water levels are recorded against time. Where the sides are unstable the pit should be filled with granular material to provide stability during the test.

Calculated soakage rates are expressed as I/m²/minute, which is a convenient rate to use. The BRE use a unit of m/sec, which is the value in I/m²/minute divided by 60,000.
